

Naked came the crook

A nude man who came to from the cold to rob a gas station early yesterday had a decided advantage, police said. The attendant was female. She fled, leaving the unarmed man free to empty the cash register, then stroll casually from the scene of the crime.

FREEBASING COCAINE

by Dr. Atomic

Freebasing cocaine is basically a California phenomenon, but it's a practice that is popular with entertainers and with others who can afford to indulge in the pleasures of cocaine. Freebase cocaine is smoked in a special, glass water pipe called a freebase pipe, and after taking a toke the onset of the high is quick: it comes on faster than snorting and almost as quick as an i.v. injection -- it's like injecting cocaine without using a needle. After inhaling the freebase cocaine vapors, your hearing drops, and you get an incredible rush even before enough time passes to exhale the smoke. Unfortunately, the rush and the high don't last long, and the desire to smoke some more coke is compulsive. In fact, it is so compulsive that people who hang around the freebase pipe, impatiently waiting to get another toke, are known in the vernacular as "freebase vultures". But before the cocaine can be smoked, it must first be prepared.

The cocaine purchased on the street is usually cocaine hydrochloride (HCl), a water soluble salt of cocaine that is suitable for snorting or injecting, but not for smoking. Cocaine HCl burns at a high temperature, about 200°C, and if it's smoked, much of the cocaine gets carbonized, burned up, instead of reaching your lungs as vapors. But, by changing the cocaine HCl to cocaine freebase, you get more of the desired cocaine vapors and less carbon because the freebase vaporizes at a much lower temperature than the cocaine HCl does.

All it takes to change the cocaine HCl into cocaine freebase is a little home chemistry. It's easy: if you can bake brownies by following a cook book, you can freebase coke. The only supplies needed are some inexpensive chemicals and equipment that are easily obtainable at your local paraphernalia shop.

Equipment and Supplies

- 1 freebase water pipe, glass
- 2 screens, fine mesh, for pipe
- 1 glass freebase vial, 1 oz., with top
- 1 mirror
- 1 single edge razor blade
- 1 box baking soda
- 1 bottle of petroleum ether or ethyl ether²
- 1 book matches or butane lighter

NOTE 1: Ethyl ether and petroleum ether will dissolve many plastics, so the tops of freebase vials are specially made of ether resistant plastic.

NOTE 2: Use caution when handling ether. The vapors of both ethyl ether and petroleum ether will ignite explosively near an open flame. Make sure that the room is well ventilated when extracting with ether. When freebasing in the kitchen, make sure the pilot lights are out on the stove and the hot water heater if they are nearby. Also, don't smoke or light matches while there are still fumes in the air.

The Freebase Process

- 1) To a 1 oz glass freebase vial, add 4ml to 6ml of warm water. Less than 1/4 of the vial is more than sufficient water.
- 2) Dissolve 1/4 to 1/2 gram of cocaine HCl in the water to make a cocaine solution. Shake or stir if necessary to dissolve the cocaine.
- 3) Add about 1/4 gram, more or less, of baking soda to the cocaine HCl solution. It is better to have an excess of baking soda than not enough. Next, shake well. This changes the cocaine HCl to the freebase.
- 4) Using a glass eyedropper, add 2ml to 3ml of ether. Shake well. The ether extracts the freebase cocaine from the water layer. As a rule of thumb, use half as much ether as water. Since ether and water do not form a solution, the ether will rise to the top and form a distinct layer.

147 W. 42 St.
New York 10036

No. 70

Because the cocaine freebase is more soluble in ether than in water, the ether layer will contain most of the freebase; in effect, the ether has extracted the freebase cocaine from the water layer. This first ether extraction is known as the "first wash". The water layer can be washed one or two more times with ether to extract the small amount of freebase remaining after the first wash.

5) Siphon off the ether layer with the eyedropper, making sure not to take any of the water layer. Drop the freebase saturated ether carefully onto a clean mirror or glass surface. When the ether evaporates, a white powder should remain: this is the cocaine freebase, and it's ready to smoke. So what are you waiting for?

The freebasing process removes some of the water soluble contaminants (cuts) like mannitol and lactose, so the yield, i.e. the weight of the cocaine freebase obtained will weigh less than the cut-coke that was started with; however, no significant amount of cocaine is lost; only the cut is removed. Thus, a gram of cocaine HCl that is only 25% pure is not a gram of cocaine but a 1/4 gram of cocaine, and the yield of freebase cocaine, for this particular sample, will be slightly less than 1/4 gram.

The cocaine freebase, however, is nearly pure, compared to the starting material, and a smaller dose of the freebase will be just as potent as a larger amount of the cut cocaine. So, start with a small hit, a match size line or less (20mg to 50mg). Remember, just like snorting or injecting, you can consume too much by smoking. Be careful how much you smoke, and be careful, too, for police and informers: cocaine is still illegal. Have fun with your chemistry projects, stay high, and stay free.

Man nabbed in phone fraud

EAST BRUNSWICK — A man who described himself as an electronics engineer has been arrested on charges stemming from the use of a "blue box," a gadget the size of a calculator that emits electronic signals that bypasses regular telephone company equipment.

Tarkeshwar Singh, 50, of 16 1st Ave. Place, was freed on his own recognizance after he was arrested yesterday in a public phone booth at a Route 18 department store. Detective Donald Henschel reported.

Singh was charged with possession of a burglary tool, the "blue box," and theft of \$300 worth of services from

New Jersey Bell Telephone Co. police said.

Investigator James Wilanek of the phone company's security division in Newark said the investigation had been in progress for several months. During that time, he said, Singh used the device for \$300 worth of phone calls in Japan and Hong Kong.

In addition to the "blue box," investigators confiscated a schematic design of the instrument which they said had been sent to Singh by an acquaintance in West Germany.

"These electronic devices are a continuing problem to the telephone company," Wilanek said.

How To Cheat Your Ass Off In Skool

"I HAVE ONLY LEARNED BY COPYING"
—MEL B. PICASSO

MAKING IT: Nice people just don't cheat. This is a fact of life. If you do cheat, you are most likely a rotten no good stinker with sommie friends, dirty underwear and a host of social diseases. The Revolutionary 3 Stooges try to discourage this type of behavior. It is both tacky and unsophisticated. We suggest that instead, you follow the advice of our friends from Take Over, in Madison Wis., by just forgetting the entire mess. Fuck Skool! Forget cheating. Print up your own degree instead and get on with living.

(1) Borrow a friend's diploma, put your name on it and make a copy suitable for framing. You can take the signature from the old diploma, and get a facsimile when the new President is named— he will probably have his signature in the papers or on all kinds of documents.

(2) If you have a Gemini friend, get the friend's transcript and put your name at the top—if the friend has a degree. Again, make a copy.

Or if you have been here one semester—and don't rush, you have 4 years to graduate the Take Over way—you can get your own transcript and simply fill it in with courses it might have been nice to take. Reduce-reflex your way, to fit the form.

Continental Company, in Chicago, a Saturn (discrete) firm will sell you a seal that works like a notary's seal for the transcript—you must emboss your list of courses and grades to give it that official look. You design the embossing seal yourself; put your birth sign in the center if you like, some Latin on the outside, with the words "University of Wisconsin." For Latin phis see suggest a little loquiter, such as PECUNIA LOQUITUR.

FAKING IT: It was this morning after. After that is, dragging myself from the gutter in front of the Moonlight Bar to the back seat of my car. A bristly black hairy tarantula ran screaming from my mouth. Unknown substances mingled with cigarette butts in my hair. I had a mid-term exam in ancient Chinese history in 2 hours. You could say that I was unprepared. I asked myself, "What would Mao tse-tse do in a case like this?" But the Red Guards were nowhere in sight. I was on my own. I entered the class, paused and slowly labled my blue book #2. I took my time writing a single grandiloquent concluding paragraph and handed it in. The professor later apologized for losing my first blue book and gave me a B. A cheat must always be resourceful. 1) Change the answers on graded tests. Bring them back to the prof and say, "Hey, I had this answer right." 2) Carry in completed blue books to the exam. 3) At the end of the quarter professors leave graded tests and term papers in the halls for their students. Take the best ones and save them for future use. 4) Keep all tests and papers to use again and again, use your friends' and visit fraternity files. 5) Remember to never put down what you plagiarized from as a source. Use master theses from other colleges, the papers kept by departments at other colleges for the "serious researcher" and obscure books from other libraries. 6) Despite propaganda, term paper companies are OK.

TAKING IT: I know of one student who walked into the school print shop as exams were being run off, sat down on a linked gaily and walked off with a set of tests on his pants. 1) Bribe or get friends who can get tests, such as janitors and print shop workers. 2) Go through waste paper cans for copies.

CRIBING IT: What I have come to call the "Ethiopian Shuffle" was given to me by a foreign exchange student and has proven to be one of the best crib notes in the business. Taking a long narrow strip of paper that is folded like an accordion into a tiny book, you are able to write 10 times the amount of info that a normal crib sheet holds. It is then manipulated with thumb and forefinger. 1) Magic shops have special pencils which write invisible notes that can be seen with special glasses. 2) Intelligence is transmitted to several cheaters through an elaborate signal system. Pen point up is true, down is false. In multiple choice, fingers at chin level mean number of question— at waist level, number of answer. 3) Put cribs on the seat next your crotch. Open your legs to see it, close them to hide it. 4) Transistorized tape recorders can be camouflaged as hearing aids. 5) Be imaginative. Hide notes everywhere. On skin and fingernails. As scrolls in objects such as watches and pens. On Kleenex, gum & cigarettes. Write on the sole of your shoe near the heel for easy reading when crossing legs. On the sole of the folds of clothes and behind sheer nylon. *VIVA LARRY, CURLY MAOE*

REVOLUTIONARY 3 STOOGES 28 AUG 68 Box 16, LIGHT BOLT 51A, Dayton OH 45409

A TRANSIT worker who took it upon himself to tackle the TA's \$1-million-a-year problem with slug tokens has come up with an ingenious \$1 solution.

Thomas Costa, a 46-year-old turnstile foreman from Astoria, invented what he calls a "rod pin" device at home.

"We were having a problem at the Greenpoint A station" where thin steel slugs were showing up regularly in token clerk buckets, he explained.

"I came up with it two

this one particular slug, but when I brought it in we found out it worked on all kinds.

The device works by measuring the width of the phony coins and dropping through those coins that don't fit the dimensions of legitimate tokens.

Forty copies of Costa's home invention were tested in several high-volume stations in Manhattan with "excellent success," a Transit Authority spokesman said yesterday.

This week, the TA ordered devices for installation

tion in every turnstile in the system.

Slugs and foreign coins, which have plagued the subway system since it was opened nearly 80 years ago, have been used at epidemic proportions since the fare was hiked to 75 cents last month.

Nearly 30,000 fare beaters have dropped phony tokens into turnstiles every week since the fare increase, according to transit police.

A peak in slug use was reached in 1976 when 109,

950 phony tokens a week were being used.

Costa submitted his invention to the TA through its employee suggestion program, which means he gives up all patent rights in the device.

"The TA couldn't pay [employees] for all the stuff they've come up with," Costa laughed.

"What did he get for developing this thing?" Costa's boss, Joe Spencer, was asked.

"I kissed him twice," Spencer said.

New electronic "watchdogs" are making it increasingly difficult to fool Ma Bell.

The watchdogs are computer monitoring systems that have been set up to fight telephone toll fraud, which cost New Jersey Bell Telephone Co. millions of dollars last year through phony credit card numbers, fraudulent third-party billing and the use of electronic devices to bypass automatic billing equipment.

The loss due to electronic fraud only can be guessed at, since the devices work by circumventing company billing. But Bell spokesman Ted Spencer said the company had lost \$2.3 million through more conventional fraud schemes in 1980. The costs eventually are passed on to customers.

Company officials say telephone bill cheaters come from all segments of society, including college students, immigrants, middle-class suburbanites, businessmen and the poor.

For example, a 70-year-old Paterson woman recently was caught charging more than \$7,000 in overseas telephone calls to Greece using a "blue box," a device that emits tones reproducing the signals that guide telephone switching equipment.

Last week, an Israeli couple was charged with making calls to Israel with a blue box from pay telephones throughout Union and Middlesex counties.

After an investigation by the telephone company, a computer analyst making \$45,000 a year was charged with making fraudulent credit card calls on his lunch hour in Iran.

John T. Cox, Bell's district staff manager of security and investigations, said the detection systems for illegal electronic devices were getting better all the time.

"If you're using a blue box on a regular basis in New Jersey, you're going to be caught," he said flatly. "I can almost guarantee it."

Escorting a visitor through a seldom-seen computer room at Bell, Cox pointed out teletype monitors that can pick up the use of the device and immediately tell investigators where a call is being made from, so that cheaters frequently are arrested by local police while still on the phone.

Those found guilty of using a blue box can be fined, jailed and forced to make restitution.

A blue box is nothing more than a tone generator that gives its user access to the telephone company's long-distance lines by fooling automatic equipment. Users generally dial an 800 toll-free number and send a pulse that allows them to dial anywhere in the world without the call registering as a toll call.

The device was named for the color of the first boxes sold through underground publications, but they have grown in sophistication. Cox displayed several confiscated boxes built into small, handheld calculators and boxes the size of a cigarette pack. A young electronics engineer from Arizona was arrested two years ago with a blue box he built directly into his telephone.

"The devices sell for up to \$500, but it's not worth it," Cox commented.

Bell prosecutes every blue box case it uncovers and works with police departments to move quickly in catching users. Because the blue boxes show no record of calls, Bell has run across cases of criminals involved in drugs and prostitution using the devices.

Cox said the use of blue boxes was falling off, explaining, "People are realizing they're going to get caught."

Since January, Bell investigators have come across 32 cases that have resulted in 13 arrests and 11 convictions.

Computer monitoring equipment also can pick out the use of other devices, such as black boxes, which avoid charges for incoming calls to a phone, and red boxes, which generate the sound of coins dropping in a pay telephone. Cox said new billing control systems soon would eliminate the electronic boxes.

Of more concern is nonelectronic fraud, which Cox said was growing nationwide. It can range from charging a long distance phone call to a stranger, to using a stolen credit card, but computers also are being put to use here.

Bell plans to introduce a special billing system that will need personal codes to operate, similar to auto-letters being used by banks. Customers also will be able to stop anyone from billing a call to their number with an automatic computer block that signals an operator not to accept such calls.

However, it is impossible to stop all fraud. Cox pointed out, "The people who are perpetrating the frauds know our systems."

"Well, let's get busy. Where there's a way, there are loopholes!"
