YOU CAN HELP TAP

Also, Magnets, Overseas Phreaking, and Chemistry.

[illegible]

Approximate value for R_t (Use trimmers)

Hz	R _t	
700	42k	For example: 700 Hz- use 50k trimmer pot, 10 or 20 turns, or else use a single turn 5k or 10k pot in series with a resistor, so that the center of the pot(1/2 the value) plus the resistor equals 42k. Thus a 10k pot at its center is 5k, plus 37k =42k.
900	35k	
1100	28k	
1300	24k	
1500	22k	
1700	18k	
2600	12k	

Build two duplicate circuits, connect outputs, ground, and power. Can drive a telephone earpiece strongly. Remove the varistor dual-diode on the earpiece before using.

Letters From Readers

Dear TAP,

A modified Starrett #23B small hole gage- available from most machinist supply companies- is an effective key for the Rollersmith lock (See issue #20 and #23). Accept no substitutes-General makes a similar tool but it is of lower quality and may require a special order. The gage is hardened steel, so you'll have to use a small bench grinder, not a file, to reduce the diameter of the ball halves and come to about .150" (That's one hundred and fifty-thousandths of an inch) unscrewed. Finish grinding by hand on a bench stone until it just enters the hole. Insert all the way, tighten, and retract it, and Voila! The lock is opened.

The gage costs about \$7 and can be sold at a nice profit. Be sure to grind the manufacturer's name and number off the gage to insure its anonymity.

Mr. Phelps

Advisable Missions Force

Note: Grind with gage unscrewed.

Dear TAP,

A good way to nail those anti-phone phreak manufacturers is to go to a pay phone and call one up. It is not necessary to pay, instead, simply call the operator and tell her that you just dialed a wrong number. In most cases, if you are convincing, she will connect you. When the company answers, have nice long talk about how good you think their device is to protect life, limb and property. Sound sincere, and stay on for as long as possible or until an operator comes on. Almost always, after using the 'wrong number' approach, the operator will forget about you, and by the time she remembers, you will already have run up a huge bill (staying on for an hour across country will come to over \$20). When you think you must, hang up, making sure you have left no clue to your identity. The operator will call back, and ask you to deposit an amount equal to GM's

yearly sales. By this time, you will be long gone, and guess who gets stuck with the bill? That's right, the gold mine manufacturer.

NEW JERSEY

Dear TAP,

Wisconsin Telephone Newline is a pretty typical Telco newline, except they have a mania for phone phreaks. They always have the latest on busts across the country, as well as up-tight references to publications they think are out to subvert them. (414) 678-3511. Unfortunately, it is scouped and you get charged if calling from outside 414 area. The info is almost worth it.

Milwaukee Ring-back- 971, wait for tone, dial 6 and hang up. Loop suffix for 414 area is XXX-0010 & 0011. They've been closed for a year but someone gets sloppy once in a while.

There's a magazine called Amateur Radio 73. It's a ham magazine supposedly published in the Northeast and distributed by ham dealers. The June 1975 issue has an article entitled "Inside Ma Bell" which (according to Wis. Telco newline) gives "precise technical details on blue box construction." I've searched for a copy but they were gone quick. You may have better luck in a library.

Incidentally Pacific NW Bell is suing the magazine for \$100,000 for distributing it in their area! Freedom of the Press? Shut.

I "have heard" that some criminally insane persons buy coin folders made for coin collectors and use the quarter and dime size cardboard discs in these as slugs. Seems these cardboard discs work in the "slide-in" type coin acceptors used in Laundromats and on small vending machines. Apparently they even work in the "slide-in" acceptors that have magnets to reject metal slugs. Although these people have to hunt around for the "wood-grain" type folders with the cardboard discs still in them, that doesn't seem to deter them.

INDIANA

Dear TAP,

Shown below is a rotating disc flowmeter. This is the type used in gas pumps, fuel oil meters and to measure water used in your house. It is usually found under a round steel plate that says "water" which is located in your yard or in the street, etc. It is held together with 6 or 8 bolts around its circumference. When these bolts are removed

hold like

everything in the meter can be removed. This is a positive displacement meter which means for every cycle or revolution of the disc a fixed amount of water is transferred & registered on the dial. The fixed amount of water is trapped in a sealed fixed space and carried thru the meter by movement of the disc. Tell your readers that it is illegal to do this but if you were to shave or grind off 1/8" off the outside circumference of the disc and then put it back in, a large amount of water will pass through without registering on the dial. This results in a large savings on

water bills. Remember that failure to put the disc back in will result in no water registering and the meter reader will get suspicious unless you tell him that you've stopped taking baths.

Please print my article cause I always wanted to get something published. Yours,
BALTIMORE

music on hold

Working Within The System Dept.

You're reading TAP because you want to smash the State, right? Want to abolish monopolies, right? Believe you have the right to do whatever you want so long as you don't force or fraud against "other" "individuals"? Would you believe there's a political party that feels the same way? It's called the Libertarian Party and has chapters in most "states". Many of the members may seem moderate to us bomb-throwing radicals, but they're "the only game in town". Headquarters are at 550 Kearny St., San Francisco, Ca. 94108. Tell them you read about them in TAP.

"Thomas Jefferson"

CORRECTED SNOOP LITE

The Snoop Light article in issue #19 listed incorrect values for the bulb and capacitor. The bulb is a #48 screw base or a #49 bayonet base, both 2 volts and 80 ma. The capacitor is a 500 mfd. at 15 volts. The complete circuit operation is as follows: When the phone is on the hook 48 volts DC is across the red and green phone wires. Since the phone is drawing no current now, the snoop light (in series with the green negative line) does not light. Ringing is a 90 volt AC 20 Hertz signal superimposed on the 48 volt phone line. The bulb's cold resistance is small no appreciable voltage develops across it, so it remains unlit. When you pick up, the bell is switched out of the circuit and a large surge current flows thru the line and bulb causing it to lite brightly. This large surge is caused by the low 100 ohm phone resistance being switched across the phone line. If you pick up during the ring the voltage is 48 plus 90 volts AC, and so this can be quite a surge. The capacitor opposes the voltage change and helps absorb the surge of current. The bulb will momentarily brighten if you pick up during a ring, so to increase bulb life only pick up between rings. If the bulb goes out while you're talking the phone will go dead. To prevent this a zener diode (5 to 10 volts, 1 watt) is added. When the bulb burns out 48 volts is across the zener and it conducts. The zener does not let the voltage across the capacitor exceed 10 volts so the capacitor is protected. Thus a 15V capacitor can be used, instead of 50V, saving space and money.

Remember, the snoop light is not a phone tap indicator, it only indicates that all extensions are hung up. It will not work on a Black Box call. If the snoop light is connected before a hold button it will also light up on hold. The hold resistor is 100 ohms 1 watt. If you Sybarites want music on hold add a 10 ohm resistor (2 watts) in series with the resistor and bulb. Connect the audio output leads of a radio or stereo with Transformer output to the 10 ohm resistor instead of the speaker it normally goes to.

TAP is working on a snoop lite that will work with a Black Box. A schematic will be printed as soon as possible. Ideas are welcome. Also we need to know if the off-book current in your area is different from 80 ma. as in New Jersey. A different bulb may be needed for different places.

complete circuit

L1, L2 = #48 or 49 Bulb
C1 = 500 Mfd/15 volts
Z = 10 Volt Zener Diode, 1 watt
R1 = 100 ohm/1 watt
R2 = 10 ohm/2 watt

R3=10K ohm/1/2 watt
C2=1 Mfd./100 volts
SW1=DPDT Switch
SW2=Momentary SPST
SW3=SPST Switch

Phone TAP

May 21, 1975 The Real Paper

While we're on the subject, we'd be remiss if we didn't pass along a Berkeley Post report that phone phreaks in the maximum security prison at Wayside Hmns. Rancho in Los Angeles have been busted on charges of making long-distance calls using counterfeit credit card numbers. The inmates are accused of running up \$500 in calls. One prisoner had the temerity to charge all his calls to the Chino, California municipal court. Another inmate, according to sheriff deputies, used the phone to call Washington and talk personally to Supreme Court Justice William O. Douglas shortly before Douglas suffered his stroke. And a third inmate, according to police, was actually using the prison phone to talk to friends on the outside to plan robberies. The scheme was discovered when the inmate called a wrong number — that of a police lieutenant.
